# 1. Introduction

---

## 1.1 Purpose

The purpose of this document is to record the findings of an internal review carried out by Taranaki Regional Council (the Council) planning and operation staff of the Council's pest animal and plant programmes.

The findings of that review were a starting point for the development and design of future pest management programmes, which have been set out in a companion document '*Future directions for pest management in Taranaki; Review of the Pest Management Strategy for Taranaki: Animals, and the Pest Management Strategy for Taranaki: Plants*'. Together these documents are informing the review of the Council's pest management strategies.

## 1.2 Background

This document contains the worksheets completed in workshops held with Council staff to apply the intervention logic model process to current and potential future pest management programmes.

The intervention logic model is increasingly being used nationally and internationally as a planning tool to review and design programmes and to test the underlying rationale for public interventions. As part of the review of its pest management strategies, the Council has applied the intervention logic model.

The process involved a series of 14 workshops held throughout February and March 2012. At those workshops, staff evaluated what outcomes are sought in relation to individual pest animal or plant species, and then evaluated how that species could be managed in the future.

## 1.3 How the intervention logic model works

The intervention logic model describes a programme as a linear sequence of components – typically it involves consideration of inputs, activities, outputs and outcomes. Set out below is an explanation of the eight component parts to be documented.

### ❖ Scoping and planning

Scoping and planning involves documenting the current situation and developing a vision for a future programme. In terms of the current situation matters typically considered were the biological characteristic and distribution of the pests, the preferred habitat, the nature and scale of adverse and unintended impacts and the overall effectiveness of existing management programme.

### ❖ Inputs

Inputs are the resources that the Council intends to invest in the proposed programme to deliver on the proposed outcomes. Inputs are used to produce the outputs and outcomes of the programme. They typically include money, equipment, poisons.

### ❖ Activities

Activities are the suite of management actions that are required to be undertaken by the Council to achieve the outputs specified for a proposed programme. Activities range from advice and education, to regulation, and the undertaking of physical works. Activities can be measured in terms of numbers of traps set, number of meetings held with the community, etc.

#### ❖ Outputs

Outputs are the tangible results of the activities in the proposed programme, goods and services produced such as possum or weed control. An output will usually be composed of a number of activities. The outputs of a programme are generally measured by some count or number, for example the residual trap catch of possum control operations, the number of reports produced, etc.

#### ❖ Intermediate and long term outcomes

Outcomes are the desired states of the community, biological system, or production sector to be achieved by the programme.<sup>1</sup>

In the logic model, outcomes were split into intermediate outcomes (e.g. "...eradicate all known infestations of climbing spindleberry in the Taranaki region over 10 years), which fed into desired long term outcomes ("...threats to the extent and condition of indigenous remnant ecosystems are avoided due to reduced infestations of climbing spindleberry").

For the revised regional pest management plan, intermediate outcome statements are valuable as they allow a short-to-medium term assessment of the difference that outputs are making to programme outcomes. Intermediate outcome statements can readily be turned into the objective for that particular programme. The outcome statement needed to define what will change as result of the intervention, and by how much (or at the very least in what direction the change will occur). This then allows the means of measuring progress towards the desired outcome to be defined<sup>2</sup>.

#### ❖ Identify stakeholders

The logic model requires the Council to consider who are the stakeholders that should be consulted with or engaged with during the plan writing stage and, thereafter, during the implementation of the programme

#### ❖ Assumptions

The link between a programme's activities and outputs and its desired outcome is based on a number of underlying premises – a set of ideas that forms the basis for delivering activities and outputs and achieving the desired outcome of a programme.

During the logic model workshops, all assumptions and expectations of how an activity or input would lead to an outcome were canvassed and documented. These were based on experience, and knowledge of the operational and policy staff participating in the workshops. Examples of assumptions made for some programmes might be there that the public good for eradication programmes exceeds the benefits accruing to individual landowners or, for widespread pests, the land owner might be best placed to carry out the control.

---

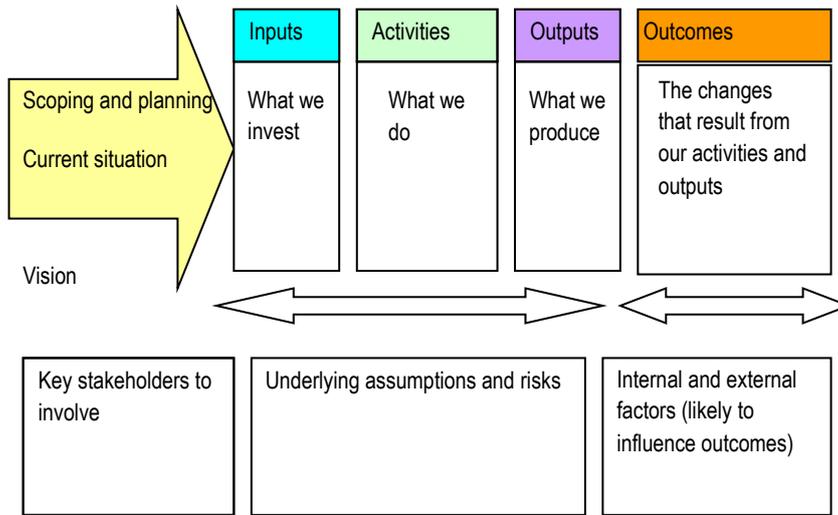

<sup>1</sup> Outcome statements were developed for each programme using the programmes vision.

<sup>2</sup> Progress towards intermediate outcomes can be measured using indicators. For example, an intermediate outcome like 'Increased stock productivity over 5 years' might be measured by the indicator 'kgs of milk solids/ha'.

❖ Internal and external factors affecting outcomes

There are many factors over which operational staff have little or no control over, which may affect the programme outcomes. It is important to document these factors, as anticipated changes in any of these factors that may trigger programme adjustments. For example, political or economic support is important to consider when designing a programme as it will determine the amount of resources available.

Figure 1 below shows a logic model worksheet with the eight main components.

**Figure 1** The Intervention Logic Model applied to pest management

## 2. Animal pest logic model worksheets

---

Set out overleaf are the worksheets that were developed for current pest animals during the intervention logic model workshops. The outcomes from this worksheets feed into the main body of this paper, where current programmes are assessed and future directions recommended.

Rooks ( <i>Corvus frugilegus</i> )		Inputs	Activities	Outputs	Outcomes	
Current situation		What we intend to invest	What we intend to do	What we intend to produce	Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication</b> pest in current RPMS (Section 5.1)</li> <li><i>Distribution</i>: 3 known rooks I in the Patea area, unsure if it still alive, 1 in Hawera and 1 in Brixton; Possibility of incursions from neighbouring regions, populations expand rapidly.</li> <li><i>Effects</i>: can become significant cropping, horticultural, and pastoral pest</li> </ul> <p>Vision Economic productivity is protected and sustained for future generations</p>		40 hours/year including investigations into new incursions	<p>Advice and education Public awareness campaign -media release - newsletter - meetings</p> <p>Surveillance</p> <p>Direct control at all sites of infestation</p> <p>Programme management, planning and monitoring</p>	<p><b>Public awareness and engagement.</b> Contractor engagement, website hits, # of public enquiries, # of workshops, # of newspaper articles</p> <p>Rook control. # of control operations</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	Prevent establishment of rooks in Taranaki.	Harm to economic activity is prevented due to absence of rooks.

Argentine ants <i>Linepithema humile</i>		Inputs	Activities	Outputs	Outcomes	
Current situation		What we intend to invest	What we intend to do	What we intend to produce	Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Containment</b> pest in current RPMS (Section 6.1)</li> <li><i>Distribution:</i> 10 known areas of infestation with approx 2000 properties infested; mostly in urban, coastal areas, and increasing in range</li> <li><i>Effect:</i> Predominantly a threat to lifestyle/ amenity values/ significant nuisance, household pest; Also a threat to horticultural production; biodiversity, compete strongly with other insects.</li> </ul> <p>Vision Amenity values in urban areas are protected and maintained for future generations.</p>		0.25 FTE	<p>Advice and education Public awareness campaign -media release - newsletter - meetings</p> <p>Surveillance and enforcement</p> <p>Identification service</p> <p>Site led control in actively managed KNEs</p> <p>Programme management, planning and monitoring</p>	<p><b>Public awareness and engagement.</b> Contractor engagement, # of website hits, # of public enquiries, # of workshops, newspaper articles</p> <p><b>Argentine Ant control.</b> Number of control operations Number of KNE's actively managed under sustained control</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Increase capacity of public/contractors to carry out Argentine ant control over 10 years.</p> <p>No reduction of rare and distinctive fauna attributable to Argentine ants in actively managed KNEs over 10 years.</p> <p><b>Current Objective:</b> To protect amenity, horticultural production, and biodiversity values by preventing the spread of Argentine ants from affected properties to neighbouring properties for the duration of this Strategy.</p>	<p>Minimise impacts of Argentine ants on amenity values in urban area</p> <p>Biodiversity increases across Taranaki due to reduced pressure from Argentine Ants</p>
<p>Key stakeholders to involve</p> <ul style="list-style-type: none"> <li>Ministry of Primary Industries</li> <li>Fish &amp; Game;</li> <li>DOC</li> <li>District Council's</li> <li>Land Occupier</li> <li>Queen Elizabeth II Trust</li> <li>Biodiversity section;</li> <li>Iwi / Hapu</li> <li>TRC (internally)</li> <li>Coastal communities</li> </ul>	<p>Underlying assumptions and risks</p> <ul style="list-style-type: none"> <li>Other regional councils are pulling back</li> <li>Not yet a known KNE problem.</li> <li>Effective though expensive control options</li> <li>Compliance with land occupier rule would be unduly onerous.</li> <li>Site led approach is the most cost effective option</li> <li>Landowner best placed to decide if they should carry out control.</li> <li>Distribution and abundance is increasing throughout coastal parts of Taranaki.</li> <li>Public enquiries are decreasing</li> </ul> <p>Pathways problem: easily spread by humans</p>	<p>Internal &amp; external factors</p> <ul style="list-style-type: none"> <li>Political support</li> <li>Community support</li> <li>Economic support</li> </ul>	<p>Conclusion</p> <p>Currently in the Taranaki region, Argentine ants are a pest for their household nuisance value in coastal urban settlements. They are not yet a known problem in KNEs, although coastal KNEs remain prone to invasion from nearby infestations. Effects on biodiversity are not well documented, but may include detrimental effects on native invertebrates and their potential to swarm over nesting native birds and chicks. Distribution and abundance is increasing throughout New Zealand.</p> <p>Eradication and sustained control programmes are not considered to be feasible or appropriate for the management of Argentine ants. It is therefore recommended that the Council adapt a site led and facilitation approach to their future management. As part of day to day pest control activities, the Council will endeavor to minimize the impact of Argentine ants on amenity values, and prevent impacts on biodiversity by:</p> <ol style="list-style-type: none"> <li>Providing advice and information to landholders (particularly in affected and/or all coastal communities) about the control of argentine ants, including: <ol style="list-style-type: none"> <li>handling enquiries;</li> <li>identifying infestations when requested;</li> <li>enabling liaison with bait suppliers/contractors;</li> <li>arranging newspaper articles to promote public awareness;</li> <li>requiring nurseries supplying riparian plants to have in place an appropriate detection / control programme;</li> </ol> </li> <li>Carrying out site led control of argentine ants in actively managed KNEs where required</li> <li>Surveillance: mapping areas of infestation in collaboration with bait suppliers/ contractors</li> <li>Planning, managing, and monitoring the programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to carry out these activities through a site led programme in the Regional Pest Management Plan. Around New Zealand, other regional councils have not succeeded in containing Argentine ant infestations. Land occupier rules are unduly onerous where there are private benefits to undertake control (eg. minimize nuisance impacts). The landowner is best placed to decide if they will carry out control. Public education campaigns have proved effective in the past in raising awareness and enabling access to bait suppliers. Site led control at significant sites will be carried out where required to protect native biodiversity.</p>			

Possums (Self Help Programme) <i>Trichosaurus vulpecula</i>		Inputs What we invest	Activities What we do	Outputs What we produce	Outcomes	
Current situation		<ul style="list-style-type: none"> <li>6.7 FTE's facilitating only</li> <li>8 FTE's in total including planning, liaison etc</li> </ul>	<ul style="list-style-type: none"> <li>Advice and education</li> <li>Site led control</li> <li><b>Enforcement.</b> &lt;10% RTC; NODs served</li> <li>Programme planning, management and monitoring</li> </ul>	<ul style="list-style-type: none"> <li><b>Public education and engagement.</b> Farm visits, trained and motivated people.</li> <li>Possum control</li> <li>Effective adaptive management programme</li> <li>Maps/data strategies and plans</li> </ul>	Intermediate	Long term

### 3. Plant pest logic model worksheets

---

Set out overleaf are the worksheets that were developed for current pest plants (and other harmful plants identified during the life of the strategy) during the intervention logic model workshops. The outcomes from this worksheets feed into the main body of this document, where current programmes are assessed and future directions recommended.

Climbing spindleberry (Oriental bittersweet) <i>Celastrus orbiculatus</i>		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication</b> pest (Section 5.1 of strategy Largely addressed via compliance regime</li> <li><i>Distribution</i>: 12 known sites, in urban, hill country areas, density of known infestations decreasing</li> <li><i>Spread</i>: vegetative/root suckering and by birds</li> <li><i>Effects</i>: Competes with and replaces indigenous biodiversity; affecting regeneration and succession.</li> </ul> <p>Vision</p> <p>Indigenous biodiversity is protected and sustained for future generations</p>		.2 FTE	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Direct control (ground control) of all known infestations at all sites?</p> <p>Inspection, surveillance and enforcement</p> <p>Programme planning, management and monitoring</p>	<p>Passive surveillance</p> <p><b>Public awareness and education.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Climbing spindleberry control.</p> <p>Reduction in area of infestation</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	Eradicate all known infestations of climbing spindleberry in the Taranaki region over 10 years.	Threats to biodiversity across Taranaki are avoided due to reduced infestations of climbing spindleberry
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers'</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Eradication is only achievable for species not yet established in the region, i.e. confined to few sites or limited extent</li> <li>The eradication of climbing spindleberry is technically feasible in a ten year timeframe</li> <li>Eradication is the most cost effective form of pest management where technically feasible</li> <li>New infestations will inevitably be discovered as a result of increased surveillance and public awareness</li> <li>Relying on land occupiers (rules) is not appropriate or equitable</li> <li>Rate payers to pay due to public benefits</li> <li>Increased focus is required on surveillance and public awareness to identify sites of interest.</li> </ul>	<ul style="list-style-type: none"> <li>Not in public eye, minimal drive from wider public</li> </ul>	<p>Climbing spindleberry, should it become established, would be a major threat to indigenous biodiversity, particularly in remnant bush ecosystems and Key Native Ecosystems, and may also establish in riparian and urban ecosystems.</p> <p>The Council will aim to eradicate all known infestations of climbing spindleberry in the region to ensure remnant and riparian ecosystems are protected from the spread and establishment of climbing spindleberry over the next 10 years. This will be done by:</p> <ol style="list-style-type: none"> <li>Increased focus on advice and information to land holders and the wider public about reporting the presence of climbing spindleberry, including: <ol style="list-style-type: none"> <li>Handling enquiries;</li> <li>Public awareness campaigns</li> <li>Media releases</li> <li>Newsletters</li> </ol> </li> <li>Inspection and surveillance</li> <li>Carrying out direct control of climbing spindleberry in all areas of infestation.</li> <li>Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to carry out these activities through an eradication programme in the Regional Pest Management Plan.</p>			

Darwin's barberry ( <i>Berberis darwinii</i> )		Inputs What intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication</b> pest with compliance regime (Section 5.2 of current strategy)</li> <li><i>Distribution:</i> Widespread, mainly central Taranaki; Stratford/Inglewood. 63 known sites. Waste ground and roadsides.</li> <li><i>Spread:</i> Free seeding, spread by birds</li> <li><i>Effects:</i> Biodiversity- suppresses regeneration and agricultural problem – impacting on carrying capacity of the land</li> </ul> <p>Vision</p> <p>Economic productivity and indigenous biodiversity is maintained for future generations</p>		.2	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p><b>Direct control</b> of all known infestations at all sites.</p> <p>Inspection, surveillance and enforcement</p> <p>Programme planning, management and monitoring</p>	<p>Passive surveillance</p> <p><b>Public awareness and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Darwin's barberry control.</p> <p>Reduction in area of infestation</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Eradicate all known infestations of Darwin's Barberry in the Taranaki region over 10 years.</p>	<p>Harm to economic activity from pests and diseases is prevented or reduced. Compliance/herbicide costs go down</p> <p>Threats to biodiversity across Taranaki are avoided due to reduced infestations of Darwin's Barberry</p>
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers'</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Eradication is only achievable for species not yet established in the region, i.e. confined to few sites or limited extent. The eradication of Darwin's Barberry is not technically feasible in a ten year timeframe</li> <li>Increased focus is required on surveillance and public awareness to identify sites of interest.</li> <li>Darwin's barberry is ecologically similar to Himalayan barberry, which is widely used as hedging in the region.</li> <li>Mainly a problem of roadsides and waste areas, not currently having major impact on biodiversity or agricultural production.</li> <li>Whole property addressed to prevent biological spread.</li> </ul>	<ul style="list-style-type: none"> <li>Not in public eye, minimal drive from wider public</li> </ul>	<p>Darwin's Barberry can be a threat to indigenous biodiversity, in remnant bush ecosystems and Key Native Ecosystems, and may also establish in riparian and urban ecosystems. It also can become an agricultural problem, impacting on the carrying capacity of the land. However, currently, Darwin's barberry is a problem on roadsides and in waste areas, and is not having a significant impact on biodiversity or agricultural production values.</p> <p>The Council will aim to carry out control of Darwin's barberry in the region through a sustained control programme in the Plan. This will be done by:</p> <ol style="list-style-type: none"> <li>Increased focus on advice and information to land holders and the wider public about reporting the presence of Darwin's barberry, including: <ol style="list-style-type: none"> <li>Handling enquiries;</li> <li>Public awareness campaigns</li> <li>Newsletters</li> </ol> </li> <li>Inspection, surveillance and enforcement</li> <li>Planning, managing and monitoring the programme and adapting the approach if necessary.</li> <li>Imposing a good neighbor rule on crown and private land to prevent biological spread of the plant and associated eternity impacts.</li> </ol>			

Giant reed ( <i>Arundo donax</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication</b> pest (Section 5.3 of the current strategy)</li> <li><i>Distribution:</i> Currently 7 known sites in coastal areas, NP, Oakura, Patea, Waitara and Onaero</li> <li><i>Spread:</i> vegetative</li> <li><i>Effects:</i> Potential threat to biodiversity values in riparian/forest margins; dense clumps suppress regeneration; obstruction of drainage channels (minor threat).</li> </ul> <p>Vision</p> <p>Indigenous biodiversity is protected and sustained for future generations</p>		.2	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p><b>Direct control</b> at all sites of infestation</p> <p>Inspection, enforcement and surveillance</p> <p>Programme management, planning and monitoring</p>	<p>Passive surveillance</p> <p><b>Public awareness and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Giant reed control.</p> <p>Reduction in area of infestation</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Reduce the distribution of all known infestations of Giant Reed in the Taranaki region over 10 years.</p> <p><b>Maintain remnant ecosystems over 10 years</b> dieback, bird counts, SEM monitors of canopy cover, number of type of species (flora and fauna)</p> <p>No reduction of rare and distinctive species in KNEs over 10 years</p>	<p>Biodiversity increases across Taranaki due to reduced pressure from Giant Reed</p>
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation,</li> <li>Federated Farmers'</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Eradication is only achievable for species not yet established in the region, i.e. confined to few sites or limited extent</li> <li>The eradication of Giant Reed is technically feasible in a ten year timeframe</li> <li>Eradication is the most cost effective form of pest management where technically feasible</li> <li>New infestations will inevitably be discovered as a result of increased surveillance and public awareness</li> <li>Relying on land occupiers (rules) is not appropriate or equitable</li> <li>Rate payers to pay due to public benefits</li> <li>Increased focus is required on surveillance and public awareness to identify sites of interest.</li> </ul>	<ul style="list-style-type: none"> <li>Not in public eye, minimal drive from wider public</li> </ul>	<p>Giant reed is a threat to indigenous biodiversity, in remnant bush ecosystems and Key Native Ecosystems, suppressing native regeneration, and potentially obstructing drainage channels</p> <p>The Council will aim to eradicate all known infestations of Giant reed in the region to ensure remnant and riparian ecosystems are protected from the spread and establishment of Giant Reed over the next 10 years. This will be done by:</p> <ol style="list-style-type: none"> <li>Increased focus on advice and information to land holders and the wider public about reporting the presence of Giant reed, including: <ol style="list-style-type: none"> <li>Handling enquiries;</li> <li>Public awareness campaigns</li> <li>Media releases</li> <li>Newsletters</li> </ol> </li> <li>Inspection and surveillance</li> <li>Carrying out direct control of Giant reed in all areas of infestation.</li> <li>Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to carry out these activities through an eradication programme in the Regional Pest Management Plan.</p>			

Mignonette Vine (madeira vine) ( <i>Anredera cordifolia</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>• <b>Eradication</b> pest (Section 5.4 of current strategy)</li> <li>• <i>Distribution</i>: Currently 53 known sites</li> <li>• <i>Spread</i>: vegetative tubers</li> <li>• <i>Effects</i>: Riparian/ forest margin problem; biodiversity threat, competition, affects succession and regeneration</li> </ul> <p>Vision</p> <p>Indigenous biodiversity is protected and sustained for future generations</p>		.2 FTE	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Direct control – ground crews</p> <p>Inspection and Enforcement</p> <p>Surveillance</p> <p>Programme planning, management and monitoring</p>	<p><b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Mignonette vine control.</p> <p>Reduction in area of infestation</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>All known infestations of mignonette vine are eradicated in the Taranaki region over/within 10 years.</p> <p><b>Maintain remnant ecosystems over 10 years</b> dieback, bird counts, SEM monitors of canopy cover, number of type of species (flora and fauna)</p> <p>No reduction of rare and distinctive species in KNEs over 10 years</p>	<p>Biodiversity increases across Taranaki due to reduced pressure from Mignonette Vine.</p>
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>• Biodiversity section,</li> <li>• Department of Conservation</li> <li>• Federated Farmers</li> <li>• Fish and Game</li> <li>• Forest and Bird,</li> <li>• Land occupiers</li> <li>• District Councils</li> <li>• Iwi</li> </ul>	<ul style="list-style-type: none"> <li>• Very difficult to control once established</li> <li>• Lack of public awareness or interest.</li> <li>• Rules are not working</li> <li>• Rate payers to pay</li> </ul>	<ul style="list-style-type: none"> <li>• Not in public eye, no drive from public</li> </ul>	<p>Mignonette Vine is a major threat to indigenous biodiversity, in remnant bush ecosystems and Key Native Ecosystems, and may also establish in riparian and forest ecosystems.</p> <p>The Council will aim to eradicate all known infestations of mignonette vine to ensure remnant ecosystems are maintained and there is no reduction of rare and distinctive flora in KNEs over the next 10 years. This will be done by:</p> <ol style="list-style-type: none"> <li>1. Providing advice and information to land holders about the control of mignonette vine, including: <ol style="list-style-type: none"> <li>a. Handling enquiries;</li> <li>b. Public awareness campaigns</li> <li>c. Media releases</li> <li>d. Newsletters</li> <li>e. Meetings</li> </ol> </li> <li>2. Inspection and enforcement of rules if required</li> <li>3. Carrying out direct control of Mignonette vine in all KNEs and areas of infestation.</li> <li>4. Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to carry out these activities through an eradication programme in the new Regional Pest Management Plan.</p> <p>It is anticipated that given the current widespread infestation of Mignonette vine, added inputs will be required to ensure outcomes are achieved.</p>			

Pampas – common and purple ( <i>Cortaderia selloana</i> , <i>Cortaderia jubata</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation		1 FTE  Putting \$ into biocontrol	Advice and education  Public awareness campaign -media release - newsletter - meetings  Direct control for KNEs  Inspections, enforcement and surveillance  Programme management, planning and monitoring	<b>Public education and engagement.</b> Number of websites, visits, meetings, brochures, public enquiries, sale of traps, workshops, trained and motivated people.  Pampas control.  Number of KNE's actively managed under sustained control,  <b>Compliance with rules</b> (NODs issued, prosecutions)  <b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.	Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication pest plant</b> (Section 5.5 of current strategy)</li> <li><i>Distribution:</i> Widespread- worst in Nth Taranaki, spreading in wild situations, worst in DOC areas.</li> <li><i>Spread:</i> Wind blown, most seeds drop within 50-60m.</li> <li><i>Effect:</i> Threat to forestry, biodiversity (sand dunes, edge effects), invades native, shading regeneration, riparian, can collapse into drain to impede water flow</li> <li><i>Benefits:</i> good shelter (in increasingly bad weather), used extensively as hedgerows</li> </ul>					<b>Maintain remnant ecosystems over 10 years.</b> % dieback, bird counts, SEM monitors of canopy cover, number and type of species (flora and fauna)  Maintain agricultural productivity over 10 years.  <b>Current objective:</b> to prevent the spread of infestations of Common Pampas and Purple pampas in the Taranaki region for the duration of the Strategy.	Biodiversity increases across Taranaki due to reduced pressure from pampas
Vision  Indigenous biodiversity is protected and sustained for future generations					<b>Conclusion</b> Pampas is clearly established and widespread in the region, therefore the eradication outcome sought for Pampas grass is not achievable and technically unfeasible. It is proposed that the Council adopts a sustained control programme for Pampas in the new Plan. The Council will aim to prevent the spread of Pampas to ensure maintenance of agricultural productivity by: <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders.</li> <li>Carrying out inspection and surveillance, and enforcement of rules if necessary.</li> <li>Imposing a good neighbor rule on crown and private land to prevent the spread of pampas to other properties.</li> <li>Carrying out direct control of Pampas infestations in KNEs</li> <li>Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol> This involves no significant change to the Councils modus operandi. The Council will continue to apply a significant regulating and compliance regime to ensure land occupiers manage the externality impacts of pampas on neighbouring land.	
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors				
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers</li> <li>Fish and Game,</li> <li>Forest and Bird</li> <li>Land occupiers</li> <li>District Councils</li> <li>NZTA</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Herbicides available for their control – Velpar (aerial application), costly</li> <li>Hedgerows- aren't really a problem unless they are seeding</li> <li>Bio-control is being actively researched</li> <li>Roadsides well controlled by NZTA in the north</li> <li>Not many complaints about plant itself, only about compliance</li> <li>77 Notices Of Direction issued 10/11, 167 in 2011/12</li> <li>Whole property addressed to prevent spread of plant.</li> </ul>	<ul style="list-style-type: none"> <li>Political interferences</li> <li>Biological control is a big hope for the future</li> </ul>				

Senegal tea ( <i>Gymnocoronis spilanthoides</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li><b>Eradication</b> pest (Section 5.6 in the current strategy)</li> <li><i>Distribution</i>: Currently around 2 known sites</li> <li><i>Spread</i>: vegetatively, dispersal of seeds by water movement.</li> <li><i>Effect</i>: biodiversity threat, diminish oxygen available to fish, impede flow of water, covers wetlands/waterways Aggressive freshwater weed</li> </ul> <p>Vision Indigenous biodiversity is protected and sustained for future generations</p>		.2 FTE	Advice and education  Public awareness campaign -media release - newsletter - meetings  Direct control  Inspection and Enforcement  Surveillance  Programme planning, management and monitoring	<b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles  Senegal tea control.  Reduction in area of infestation  <b>Compliance with rules.</b> NODs issued, prosecutions  <b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.	All known infestations of Senegal Tea are eradicated in the Taranaki region over/within 10 years.  <b>Maintain remnant ecosystems over 10 years</b> dieback, bird counts, SEM monitors of canopy cover, number of type of species (flora and fauna)  No reduction of rare and distinctive species in KNEs over 10 years	Biodiversity increases across Taranaki due to reduced pressure from Senegal Tea.
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers'</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Recreational water users</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Lack of public awareness or interest.</li> <li>Rules are not working</li> </ul>	<ul style="list-style-type: none"> <li>Not in public eye, no drive from public</li> </ul>	Senegal Tea is a threat to indigenous biodiversity in waterways, forming dense floating mats which can exclude submerged flora, depleting food and oxygen sources for fish; displacing traditional Maori food sources; and interfering with recreational activities.  The Council will aim to eradicate all known infestations of Senegal Tea to ensure remnant ecosystems are maintained and there is no reduction of rare and distinctive flora in KNEs over the next 10 years. This will be done by: <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders.</li> <li>Inspection and enforcement of rules if required</li> <li>Carrying out direct control of Senegal tea in all KNEs and areas of infestation.</li> <li>Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol> The Council proposes to continue these activities through an eradication programme in the new Regional Pest Management Plan.			

<b>Undaria</b> ( <i>Undaria pinnatifida</i> )		<b>Inputs</b> What we intend to invest	<b>Activities</b> What we intend to do	<b>Outputs</b> What we intend to produce	<b>Outcomes</b>	
<b>Current situation</b>					<b>Intermediate</b>	<b>Long term</b>
<ul style="list-style-type: none"> <li><b>Eradication pest</b> (Section 5.7 in current strategy)</li> <li><i>Distribution</i>: Limited distribution, confined to Port Taranaki, decreasing, prefers man made structures</li> <li><i>Spread</i>: spores</li> <li><i>Effect</i>: Significant effect on marine farming, however not an issue here unless ventures established, Once established can replace or exclude native seaweed species and associated marine flora</li> </ul>		0.25 FTE	Advice and education  Public awareness campaign -media release - newsletter - meetings  Site led control at Port Taranaki  Surveillance  Programme management, planning and monitoring	<b>Public education and engagement.</b> Number of websites, visits, meetings, brochures, public enquiries, sale of traps, workshops, trained and motivated people.  <i>Undaria</i> control  Number of sites where hare control is undertake, McLean scale  <b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.	Maintain biodiversity of the Sugar Loaf Islands and other nearby significant marine sites  Reduce likelihood of new infestations of <i>Undaria</i> in Port Taranaki	Marine biodiversity is maintained in marine ecosystems due to reduced pressure from invasive seaweeds.
Vision						
Indigenous marine biodiversity is protected and maintained for future generations.						
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>Port Taranaki</li> <li>Sportfishing/underwater club</li> <li>TRC internally</li> <li>Department on Conservation</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>District Councils</li> <li>Iwi/hapu</li> </ul>	<ul style="list-style-type: none"> <li>Highly invasive</li> <li>Very hard to control, expensive and time intensive.</li> <li>The seabed and Port Taranaki ownership/management could pose legal issues</li> <li>By kills are likely from control</li> <li>New incursions are a constant threat</li> <li>May have beneficial qualities – edible?</li> <li>Notification rule may be appropriate</li> </ul>		<p><i>Undaria</i> is a threat to marine biodiversity and potential marine farming ventures, due its ability to rapidly invade man made structures. Once established it can exclude native seaweed species and associated marine flora. <i>Undaria</i> is confined to Port Taranaki, but poses a threat to the nearby Sugar Loaf Islands and Ngamoutu Marine Reserve. Eradication of the pest, as proposed in the current strategy is technically unfeasible, and management is better focused on maintaining infestations at low levels, and reducing spread through pathways (hull and ballast water).</p> <p>The Council (in partnership with Port Taranaki and the Department of Conservation) will aim to reduce infestations of <i>Undaria</i> and reduce likelihood of new infestations in Port Taranaki through a <b>site-led programme</b>. This will be done by:</p> <ol style="list-style-type: none"> <li>1. Providing advice and information to key stakeholders.</li> <li>2. Carrying out surveillance and monitoring to note any new infestations</li> <li>3. Carrying out direct control of <i>Undaria</i> infestations</li> <li>4. Planning, managing and monitoring the programme and adapting the approach if necessary.</li> </ol>			

Australian sedge ( <i>Carex longebrachiata</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>Containment pest – current boundary rule – Section 6.1 of the current strategy)</li> <li><i>Distribution</i>: 3 extensive infestations. 2 at Waitotara covering several farms and 1 at Mohakatino.</li> <li><i>Spread</i>: by stock movement- potential for infestations to affect other properties.</li> <li><i>Effect</i>: encroaches onto pasture land, excludes pasture species</li> </ul> <p>Vision</p> <p>Economic productivity is maintained for future generations.</p>		.00001 FTE	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Direct control at KNEs</p> <p>Inspection and Enforcement</p> <p>Surveillance</p> <p>Programme planning, management and monitoring</p>	<p><b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Australian Sedge control.</p> <p>Reduction in area of infestation</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Increase capacity of landowners to carry out control of Australian Sedge control over 10 years.</p> <p>Maintain agricultural production over 10 years.</p>	<p>Harm to economic activity from pests and diseases is prevented or reduced.</p> <p>Compliance/herbicide costs go down</p>

This will require an increase/decrease in inputs to ensure outcomes are achieved</p>			

Giant buttercup ( <i>Ranunculus acris</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>Containment pest with compliance regime (section 6.2 of current strategy)</li> <li><i>Distribution</i>: Localised problem in Stratford, Opunake Inglewood, Mangatoki. Has maintained distribution over last 10 years. Mostly dairying problem. Around 155 sites in total.</li> <li><i>Spread</i>: Seed heavy, drops close to the plant, can be spread by animals/hay</li> <li><i>Effect</i>: can overwhelm pasture species reducing pasture and dairy production.</li> </ul> <p>Vision Economic productivity is maintained for future generations</p>		0.5 FTE	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Inspection and Enforcement</p> <p>Programme planning, management and monitoring</p>	<p><b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Giant buttercup control.</p> <p>Initial bio-control populations established</p> <p><b>Compliance with rules.</b> NODs issued, prosecutions</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Maintain and increase stock productivity over 10 years \$/ha</p> <p>Increased pasture growth over 10 years</p>	<p>Harm to economic activity from pests and diseases is prevented or reduced.</p> <p>Compliance/herbicide costs go down</p>
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers'</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>New Zealand Transport Authority NZTA</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Limited options in the tool box</li> <li>Difficult to control - constant effort for huge cost,</li> <li>Control can upset normal paddock rotation</li> <li>Increasing resistance to herbicide</li> <li>Taranaki Regional Council currently only council with rules for buttercup</li> <li>Has potential to spread through dairy and beef country</li> <li>25m boundary rule sufficient to prevent spread in dairy country</li> </ul>	<ul style="list-style-type: none"> <li>Political support</li> <li>Community support</li> <li>Economic support</li> </ul>	<p>Giant buttercup is a threat to agricultural productivity due to its ability to encroach on pasture land, excluding and competing with pasture species.</p> <p>The Council will aim to prevent the spread of Giant Buttercup to ensure maintenance of agricultural productivity by:</p> <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders.</li> <li>Carrying out inspection and surveillance, and enforcement of rules if necessary.</li> <li>Imposing a good neighbor rule within 25m of the boundary on dairying land only to prevent the spread of giant buttercup to other properties.</li> <li>Planning, managing and monitoring the sustained control programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to carry out these activities through a sustained control programme in the new Regional Pest Management Plan. Dairy farms are to target the entire farm, therefore boundary rules will not apply.</p>			

Giant gunnera ( <i>Gunnera manicata</i> , <i>G. tinctoria</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>• <b>Containment</b> pest (Section 6.3 of current strategy)</li> <li>• <i>Distribution</i>: widespread in wetland, riparian, coastal. Approximately 182 known sites in 2012.</li> <li>• <i>Spread</i>: free seeding, seed spread by water and birds, underground rhizomes form clumps</li> <li>• <i>Effect</i>: Threat to indigenous biodiversity values, form dense colonies shading out and suppressing regeneration of indigenous flora.</li> </ul>		0.25	Advice and education  Public awareness campaign - media release - newsletter - meetings  Site led control  Inspections and Enforcement  Programme planning, management and monitoring	<b>Public education and engagement.</b> Number of websites, visits, meetings, brochures, public enquiries, workshops, trained and motivated people.  Giant Gunnera control  Compliance with rules  NODs issued  <b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.	<b>Maintain remnant ecosystems over 10 years</b> dieback, SEM monitors of canopy cover, number of type of species (flora and fauna)  No reduction of rare and distinctive species in KNEs over 10 years	Biodiversity increases across Taranaki due to reduced pressure from Giant Gunnera.
Vision						
Indigenous biodiversity is protected and maintained for future generations						
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>• TRC internally</li> <li>• Department of Conservation</li> <li>• Federated Farmers'</li> <li>• Fish and Game,</li> <li>• Forest and Bird,</li> <li>• Land occupiers</li> <li>• District Councils</li> <li>• Iwi/ hapu</li> </ul>	<ul style="list-style-type: none"> <li>• Herbicides are effective</li> <li>• Control is achievable on private land</li> <li>• Ease of compliance (precautionary approach)</li> <li>• Difficult to control and eradicate</li> <li>• Whole property to be addressed by good neighbour rule to prevent biological spread and associated externality impacts on neighbours.</li> </ul>	<ul style="list-style-type: none"> <li>• Political support</li> <li>• Community support</li> <li>• Economic support</li> </ul>	Giant gunnera is a threat to indigenous biodiversity, with the ability to shade out and suppress regeneration of native flora. Giant gunnera is widespread in wetland, riparian and coastal areas.  To maintain biodiversity the Council proposes to continue the sustained control programme for Giant gunnera by: <ol style="list-style-type: none"> <li>1. Providing advice and information to key stakeholders.</li> <li>2. Carrying out inspection and surveillance, and enforcement of rules if necessary.</li> <li>3. Imposing a good neighbor rule to prevent the spread of Giant gunnera to other properties.</li> <li>4. Planning, managing and monitoring the sustained control programme and adapting the approach if necessary.</li> </ol>			

Gorse ( <i>Ulex europaeus</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>Containment pest (Section 6.4 of current RPMS)</li> <li><i>Distribution:</i> Widespread, found everywhere, urban problem- Notices of Direction issued in urban areas 90% of the time. Approx 536 known sites</li> <li><i>Spread:</i> Seed persists in the environment after control.</li> <li><i>Effect:</i> Impacts on amenity values and production</li> </ul> <p>Vision</p> <p>Economic productivity is maintained for future generations</p>		0.5 FTE	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Inspection and Enforcement</p> <p>Bio- control</p> <p>Programme planning, management and monitoring</p>	<p><b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, newspaper articles</p> <p>Gorse control.</p> <p>Initial biocontrol populations established, direct control</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	Maintain and increase stock productivity over 10 years \$/ha	Harm to economic activity from pests and diseases is prevented or reduced. Compliance/herbicide costs go down
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC internally</li> <li>Department of Conservation</li> <li>Federated Farmers</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Iwi/hapu</li> </ul>	<ul style="list-style-type: none"> <li>Production and amenity pest</li> <li>Could become problem in riparian</li> <li>Landholder is best placed to carry out control</li> <li>Good nursery plant</li> <li>25m boundary distance sufficient to prevent biological spread of the plant and associated externality impacts on neighbours</li> </ul>	<ul style="list-style-type: none"> <li>Political support</li> <li>Community support</li> <li>Economic support</li> </ul>	<p>Gorse is widespread throughout the region, however infestation levels are decreasing. The desired intermediate outcome for Gorse is protection of agricultural production values. However, in documenting the current inputs, it was clear that the majority of enforcement actions (around 90%) have occurred in urban areas, to protect amenity values of neighbouring residential properties.</p> <p>The proposed <b>sustained control</b> programme for Gorse is considered appropriate for the management of this species, however the Council recommends that any good neighbour rule should only apply to rural properties. The Council will carry out the sustained control programme by:</p> <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders.</li> <li>Carrying out inspection and surveillance, and enforcement of rules if necessary.</li> <li>Imposing a good neighbor rule to prevent the spread of gorse to other properties.</li> <li>Planning, managing and monitoring the eradication programme and adapting the approach if necessary.</li> </ol>			

Thistles (nodding, plumeless, variegated) ( <i>Carduus nutans</i> , <i>Carduus acanthoides</i> , <i>Silybum marianum</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<ul style="list-style-type: none"> <li>• <b>Containment</b> pest (Section 6.5 of current RPMS)</li> <li>• <i>Distribution</i>: Isolated problem on dairy farms where spraying regimes are in place. 11 sites of nodding thistle, 1 site of plumeless thistle, 3 sites of variegated thistle.</li> <li>• <i>Spread</i>: Thistles spread for miles by wind (also through hay and animal pathways).</li> <li>• <i>Effect</i>: dense stands suppress pasture and can obstruct livestock movement</li> </ul>		.1 FTE	Advice and education  Public awareness campaign - media release - newsletter - meetings  Inspection and Enforcement  Bio-control  Programme planning, management and monitoring	<b>Public education and engagement.</b> Farm visits, trained and motivated people.  <b>Thistle control</b> compliance with rules, number of NODs issued, feedback from meetings/councillors, adverse externalities managed. Bio control populations established.  Compliance with rules  Effective adaptive management	Maintain and increase stock productivity over 10 years \$/ha	Harm to economic activity from pests and diseases is prevented or reduced. Compliance/herbicide costs go down
Vision						
Economic productivity is maintained for future generations						
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>• TRC internally</li> <li>• Federated Farmers'</li> <li>• Fish and Game,</li> <li>• Forest and Bird,</li> <li>• Land occupiers</li> <li>• District Councils</li> <li>• Iwi/hapu</li> </ul>	<ul style="list-style-type: none"> <li>• Biological control is effective and spreading.</li> <li>• Control expenses will come down over time if adequately controlled.</li> <li>• Easy win (control doesn't require many resources, supported by farmers, easy to control)</li> <li>• Biological control for nodding thistle is successful (crown weevil)</li> <li>• Whole property to be addressed on dairy land by good neighbour rule to prevent biological spread and associated externality impacts on neighbours.</li> <li>• 25m buffer distance sufficient in eastern hill country to address biological spread and associated externality impacts</li> </ul>	<ul style="list-style-type: none"> <li>• Weather</li> <li>• Stock numbers</li> <li>• Natural disasters/ biosecurity threats</li> <li>• Political/stakeholder support</li> </ul>	The Council will continue to carry out surveillance and provide advice and information with regards to the management of thistles, as a <b>sustained control programme</b> in the Regional Pest Management Plan. This will be done by: <ol style="list-style-type: none"> <li>1. Providing advice and information to key stakeholders.</li> <li>2. Continuing to administer bio control agents where necessary</li> <li>3. Planning, managing, monitoring and adapting the approach if necessary</li> <li>4. Imposing a good neighbor rule on dairy land to prevent the spread of nodding and plumeless thistle to other properties.</li> <li>5. Imposing a 25m boundary rule on crown and private land to prevent the spread of nodding and plumeless thistle to other properties.</li> </ol>			

Old man's beard ( <i>Clematis vitalba</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes		
Current situation					Intermediate	Long term	
<ul style="list-style-type: none"> <li>• <b>Containment</b> pest plant (Section 6.6 of current RPMS)</li> <li>• <i>Distribution</i>: heavy around south and coastal Taranaki. Continuing to spread. 265 sites. Isolated patches in urban areas and sacrificial catchments (1500ha); not yet problem in eastern hill country. Problem in DOC reserves</li> <li>• <i>Spread</i>: Pathways via mulching hedges, birds and water, Spread within 100m (80% germination)</li> <li>• <i>Effect</i>: competition and suppression of flora, problem for hedgerows, riparian margins, environmental problem in native environments.</li> </ul>		2 FTEs (biodiversity and LM)  1 FTE of other council section support	Advice and education   Biological control   Direct control   <b>Inspections and Enforcement.</b> Notices of Direction (NODs) served   Programme planning, management and monitoring	<b>Public education and engagement.</b> Farm visits, trained and motivated people.   Old mans beard control   Compliance with rules NODs served  Effective adaptive management programme  Maps/data strategies and plans	<b>Maintain remnant forest health over 10 years</b> % dieback, bird counts, SEM monitors of canopy cover, number of type of species (flora & fauna)	Biodiversity increases across Taranaki due to reduced pressure from old man's beard   Riparian programme is protected due to reduced pressure from old man's beard	
Vision					Maintain and enhance the condition of riparian margins of Taranaki ring plain rivers and streams over ten years.		<b>Current objective:</b> To prevent the spread and, if practicable, reduce infestations of old man's beard in the Taranaki region for the duration of the strategy.
Indigenous biodiversity is protected and maintained for future generations					To reduce heavy infestations of old man's beard in the Kaupokonui stream, Patea river and Waingongoro River through the release and distribution of biological control agents.		
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion				
<ul style="list-style-type: none"> <li>• TRC internally</li> <li>• Land management section</li> <li>• Department of Conservation</li> <li>• Federated Farmers'</li> <li>• Fish and Game,</li> <li>• Forest and Bird,</li> <li>• Land occupiers</li> <li>• District Councils</li> <li>• Iwi/hapu</li> </ul>	<ul style="list-style-type: none"> <li>• Land occupier is best placed to undertake control</li> <li>• Will continue to spread</li> <li>• Unknown areas exist</li> <li>• No economic loss to farmers</li> <li>• Old mans beard control has biodiversity and riparian benefits</li> <li>• Enforcement works/changes behaviour</li> <li>• Infestations in sacrificial catchments are accessible</li> <li>• Risk: biocontrol agent not working</li> <li>• Compliance programme (protecting DOC and responding to complaints.</li> <li>• 50m buffer distance sufficient to address biological spread</li> </ul>	<ul style="list-style-type: none"> <li>• Landowner control is successful</li> <li>• Staff capability/capacity</li> <li>• Effective biocontrol</li> <li>• Landowner ability to pay for environmental pests vs production pests</li> <li>• Climate change impacts</li> </ul>	Old Mans beard is a significant threat to indigenous biodiversity values in the Taranaki region, suppressing regeneration and smothering second growth indigenous forest. The vine is proving difficult to control, and current control methods are not proving effective in areas of heavy infestations  The Council proposes to continue the <b>sustained control programme</b> for old mans beard, but with a focus on empowering and supporting landowners to carry out control – similar to the possums self help programme. The Council will do this by: <ol style="list-style-type: none"> <li>1. Providing advice and information to key stakeholders.</li> <li>2. Continuing to administer bio control agents where necessary</li> <li>3. Planning, managing, monitoring and adapting the approach if necessary</li> <li>4. Imposing a 50m boundary rule in badly affected catchments to prevent the spread of old mans beard to other properties.</li> </ol> This programme will require an increase in inputs to achieve its objectives.				

Ragwort ( <i>Jacobaea vulgaris</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes

Its dense cover of branches and its rotting leaves can smother existing low growing plant communities and inhibit regeneration. Currently tutsan is restricted to waste areas and road cuttings, especially in the eastern hill country.</p> <p>The current limited distribution of tutsan does not have a significant effect on indigenous biodiversity or agricultural production. However, the Council will continue to carry out surveillance and provide advice and information with regards to the management of tutsan <b>outside</b> of the Plan by:</p> <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders:</li> <li>Carrying out surveillance and monitoring to note any new infestations</li> <li>Planning, managing, monitoring and adapting the approach if necessary.</li> </ol>			

Hornwort ( <i>Ceratophyllum demersum</i> )		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation					Intermediate	Long term
<p>Not in current strategy</p> <p><b>Distribution:</b> Significant infestation found in Lake Rotorangi, April 2012.</p> <p><b>Spread:</b> recreational lake users</p> <p><b>Effects:</b> Aggressive freshwater weed, affecting water quality, aquatic biodiversity, hydro-electric power generation</p> <p>Vision</p> <p>Indigenous aquatic biodiversity and water quality is protected and maintained for future generations.</p>		0.05	<p>Advice and education</p> <p>Public awareness campaign -media release - newsletter - meetings</p> <p>Surveillance</p> <p>Programme planning, management and monitoring</p>	<p><b>Public education and engagement.</b> Contractor engagement, website, public enquiries, workshops, signage, newspaper articles</p> <p><b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.</p>	<p>Increase public awareness to prevent the spread of hornwort between lakes in the region.</p> <p>Reduce likelihood of new infestations in lakes in the region (pathways management)</p>	<p>Biodiversity is maintained in the freshwater ecosystems due to reduced pressure from invasive freshwater weeds.</p>
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>TRC - internally</li> <li>Department of Conservation</li> <li>Trust power</li> <li>Recreational lake users</li> <li>Fish and Game,</li> <li>Forest and Bird,</li> <li>Land occupiers</li> <li>District Councils</li> <li>Lake Rotokare</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>NIWA/ trust power study confirmed unlikely hornwort will have a significant effect on water intakes for power generation in Lake Rotorangi</li> <li>Eradication wont be cost effective or technically feasible (could cost up to \$400,000 each year)</li> <li>Pathways management to prevent spread is number 1 priority.</li> <li>Raise awareness through annual check clean dry programme.</li> <li>Controlled using selective herbicide diquat</li> </ul>	<ul style="list-style-type: none"> <li>High public interest in the pest</li> <li>Political pressure</li> <li>Economic</li> </ul>	<p>Hornwort is a highly invasive aquatic plant that has the potential to negatively freshwater quality, aquatic biodiversity values, and recreational use. As the weed is highly invasive, it could easily be spread by recreational users to other lakes in the region. Trustpower commissioned NIWA to conduct a study of Lake Rotorangi in June 2012 and concluded that the pest was not likely to have a significant effect on hydro-electric power generation. The study confirmed that hornwort is well established and widespread throughout Lake Rotorangi. The Council remains the lead agency for the management of this pest.</p> <p>The programme will be carried out through:</p> <ol style="list-style-type: none"> <li>Providing advice, education to key stakeholders to increase awareness of the ease of spread: erection of signs, Check Clean Dry summer awareness campaign</li> <li>Carrying out surveillance and monitoring to note any new infestations through the SEM programme</li> <li>Planning, managing and monitoring the programme and adapting the approach if necessary.</li> </ol> <p>The Council proposes to restrict the spread of Hornwort through a pathways programme, outside of the Plan. The Check Clean Dry summer campaign is a key opportunity for encouraging recreational users to prevent the spread of hornwort, didymo, and other freshwater pests. The Council will continue to liaise with DOC, Trustpower, NIWA and Iwi to ensure hornwort is effectively managed outside of the Regional Pest Management Plan.</p>			

<i>Grateloupia turuturu</i>		Inputs What we intend to invest	Activities What we intend to do	Outputs What we intend to produce	Outcomes	
Current situation		0.25 (with <i>Undaria</i> )	Advice and education  Public awareness campaign -media release - newsletter - meetings  Site led control at Port Taranaki  Annual Surveillance  Programme management, planning and monitoring	<b>Public education and engagement.</b> Number of websites, visits, meetings, brochures, public enquiries  <i>Grateloupia</i> control  Number of sites where control is undertaken, amount of biomass gathered  <b>Effective adaptive management programme.</b> Operative strategies/plans, data information and maps.	Intermediate	Long term
<ul style="list-style-type: none"> <li>New discovery- not currently in strategy</li> <li><i>Distribution:</i> Limited distribution, confined to Port Taranaki, Waitara</li> <li><i>Spread:</i> Highly invasive, easily spread by ballast water, ship hulls.</li> <li><i>Effects:</i> once established can replace or exclude native seaweed species and associated marine flora.</li> </ul>					Maintain biodiversity of the Sugar Loaf Islands and other nearby significant marine sites	Biodiversity is maintained in the marine ecosystem due to reduced pressure from invasive seaweeds.
Vision  Indigenous marine biodiversity is protected and maintained for future generations.					Reduce likelihood of new infestations in Port Taranaki (pathways management)	
Key stakeholders to involve	Underlying assumptions and risks	Internal & external factors	Conclusion			
<ul style="list-style-type: none"> <li>Port Taranaki</li> <li>Department of Conservation</li> <li>Ministry of Primary Industries</li> <li>TRC internally</li> <li>Fish and Game</li> <li>Sportfishing and underwater club</li> <li>Nga motu Marine Reserve Society.</li> <li>Iwi</li> </ul>	<ul style="list-style-type: none"> <li>Very hard and expensive to control.</li> <li>There are currently no effective control tools to manage widespread organisms in the marine environment</li> <li>New incursions are likely, therefore it is not feasible to eradicate (ballast water, hull fouling)</li> <li>Possibility of by-kills as it can be hard to identify from native species</li> <li>May have beneficial qualities – edible?</li> <li>the limited ability to prevent onward spread via natural dispersal and the risk of new or additional infestations in other regions being spread to Taranaki via pathway</li> <li>ownership of the seabed/port Taranaki could pose legal problems for management</li> <li>notification rule may be appropriate</li> </ul>	<ul style="list-style-type: none"> <li>Political support (MPI)</li> <li>Community support</li> <li>Economic support</li> </ul>	TRC is the lead agency responsible for coordinating <u>regional</u> intervention in the Taranaki marine environment. The Ministry of Primary Industries and DOC play a supporting role. MPI have previously made the decision that <i>Grateloupia</i> cannot be eradicated or contained nationally. Whilst <i>Grateloupia</i> poses a significant risk to marine farming, this is not an issue in the Taranaki region unless ventures are established.  To protect the biodiversity of the marine environment, especially that surrounding the sugar loaf islands, the Council proposes to manage <i>Grateloupia</i> through a site-led pathway programme (in partnership with the Port and DOC). This will involve: <ol style="list-style-type: none"> <li>Providing advice and information to key stakeholders about <i>Grateloupia</i></li> <li>Carrying out surveillance and monitoring to note any new infestations</li> <li>Carrying out direct control of <i>Grateloupia</i> infestations</li> <li>Monitoring pathways</li> <li>Planning, managing and monitoring the sustained control programme and adapting the approach if necessary.</li> </ol>
